

CAPSTONE PROGRAM • DAY 5

Demo, Review & Final Submission

Present your work, learn from your peers, and ship the final repo.

Documentation

Live Demo

Peer Review

Final Submission

Today's Agenda

From wrap-up documentation to a submitted, demoed capstone project.

01

Prepare Documentation

Problem statement, architecture, demo script, runbook & learnings

02

Live Group Demo Session

Present your working system to instructors and peers

03

Peer Review & Feedback

Review other teams' projects and exchange structured feedback

04

Final GitHub Submission

Push, tag, and submit your finished repository

01

Prepare Final Documentation

A capstone isn't finished until it's explainable. Cover five things, no more, no less.

Problem

What problem does this solve, and for whom?

Architecture

System diagram, key components, data flow

Demo

What to show, in what order, and why

Runbook

How to deploy, operate, and troubleshoot it

Learnings

What worked, what you'd do differently

Live Group Demo Session

Each team gets the floor — show the system running end to end.

Time-boxed slot

Each group presents in a fixed window — keep it tight and rehearsed.

Architecture recap

30-second refresher on the system before diving into the live run.

End-to-end walkthrough

Trigger the real pipeline: deploy, CI/CD run, app in action on Azure.

Highlight the hard part

Call out the trickiest problem solved and how testing caught it.

03

Peer Review & Feedback

Swap projects with another team. Structured feedback beats vague praise.

What to Review

- Does the deployed app actually work end to end?
- Is the architecture sound and clearly explained?
- Are tests meaningful — unit, integration, load?
- Is the CI/CD pipeline automated and reliable?
- Is documentation clear enough for a stranger to run it?

How to Give Feedback

- Lead with one specific thing that worked well
- Be concrete: point to a file, screen, or metric
- Frame gaps as questions, not verdicts
- Suggest one improvement they could act on today
- Keep it kind, direct, and time-boxed

04

Final GitHub Repo Submission

Before you submit, walk through this checklist as a team.

- ✓ README covers problem, architecture, setup & demo steps
- ✓ Dockerfile and docker-compose build cleanly from a fresh clone
- ✓ CI/CD pipeline config (e.g. GitHub Actions) is committed
- ✓ Unit, integration & load test suites are included and passing
- ✓ Runbook documents deploy & rollback steps for Azure
- ✓ Final commit is tagged (e.g. v1.0) and pushed to main
- ✓ Repo access / link shared with instructors before deadline

Submit Checklist

```
git add . && git commit -m  
"final: capstone v1.0"
```

```
git tag v1.0
```

```
git push origin main --tags
```

```
Share repo link + Azure demo URL
```

You built it. Now ship it.

Demo confidently, review generously, and submit on time. Congratulations on completing the capstone.
